We will insert this one in viewsports in the layout. Just select the Xref from drawing area then type PR and type. Often, this happens due to the inadequate range of hatches that can be easily adjusted from the hatch creation panel to make them look correct. Section of patterns and change the scale, as shown in the picture below.

Escalating ViewportsDrawings are often made in the template space, but the text, title blocks and other necessary drawing-related information are usually added in the layout or paper space. For example, a 2 scale factor will increase the size to double its original value and a 3 scale factor will increase the size three times. Investing the scale factor and pressing the input. To correct this, we need to scale this image again with reference to any dimension existing in the plant image. Start the scale command. Type 10 and press Enter, this is the current length of the window along the x axis command line. Now you need to select the base point. You can scale your xrefs while inserting them or can change their size even after inserting them into the drawing. For this example, I will use a DWG file, but you can use the same method for pdf file and images.type and press Enter, the attachment window will open. You can also watch the video shown below to learn more about the scale drawings in the paper space or in the layouts. Start by selecting Layout 1 in the bottom left tabs, you can also press the + icon to make a new layout guide. The layout space will be opened with a default viewport and the design of your template space will be added automatically. In that case, type 17 and press Enter again. Now the base of the window become 17 units in length and height of the window will automatically change proportionally.As you can see, this command is quite useful if you want to change the size of an object with reference to other existing objects or any reference length and in this case, you obviously don't need to specify the scale factor.Scaling BlocksThe scale commands explained above will work for block references too and you don't need to use any special property to scale blocks. Let's assume that we want to add a scale of 1:6 in this list, for that click on add button.In the name field of the next window add 1:6 and then add 1 in the paper unit and 6 in the drawing unit field. To explain scale command I will use this simple window block which has the size of 10 unit along the X-axis and 15 units along Y-axis.Select the scale tool from Modify panel of the home tab or use its command SC.Now select the window drawing and press enter. To add the custom scale select any viewport then click on scale option from the status bar as shown in the image above and select the Custom option from the list of scales.Edit Drawing Scale window will open up. This scale factor actually determines the final size of your window.A scale factor of 0 to 1 will decrease the size of your object (in this case window). Now select the floor plan image and press enter again. To insert the block use I command.Type I and press enter, the Insert window will show up. up.
